Aim:

Write a program to find the (multiplication of two matrices).

At the time of execution, the program should print the message on the console as:

Exp. Name: Write a C program to find the Multiplication of Two matrices by

```
Enter the row & column sizes of matrix-1 :
```

For example, if the user gives the input as:

checking compatibility

```
Enter the row & column sizes of matrix-1 : 3 2
```

Next, the program should print the message on the console as:

```
Enter matrix-1 6 elements :
```

if the user gives the input as:

```
Enter matrix-1 6 elements : 1 2 3 4 5 6
```

Next, the program should print the message on the console as:

```
Enter the row & column sizes of matrix-2:
```

if the user gives the input as:

```
Enter the row & column sizes of matrix-2 : 2 3 \,
```

Next, the program should print the message on the console as:

```
Enter matrix-2 6 elements :
```

if the user gives the input as:

```
Enter matrix-2 6 elements : 4 5 6 7 8 9
```

then the program should print the result as:

```
The given matrix-1 is
1 2 3
4 5 6
The given matrix-2 is
4 5
6 7
8 9
Multiplication of two matrices is
40 46
94 109
```

Note: 1 Do use the **printf()** function with a **newline** character (_n).

Note: 2 Display MItiplication is not possible if multiplication operation can not be performed.

Source Code:

```
#include<stdio.h>
int main()
   int r1,c1,r2,c2,a[100][100],b[100][100],mul[100][100],i,j,k;
